

To whom it may concern,

I have been requested to write a recommendation letter for the Institute of Electronics and Computer Science (EDI). As a Supply Chain Leader, I have had the pleasure to work with them from April 2017 to June 2020, working as partners in the AutoDrive project, which pertains to the SAE automation Level 4 for a 12-meter long shuttle bus.

EDI was a key partner and leverage to fulfill common objectives working with an exceptional level of research, development and innovation character. In the project, they handled a wide spectrum of activities, ranging from hardware and software development to system integration and eventually acting as transversal reference partners.

Moreover, their important contribution made possible solutions regarding infrastructure for vehicle communications (I2V) focused on full-electric vehicles, including the fail-operational approach for embedded system architectures in automated driving.

EDI has consistently delivered high-quality work and results, with the initiative to search for added value solutions. This has been supported by their honest and friendly nature, technical credibility and exemplary commitment to the project goals, even over long periods of remote working.

We undoubtedly expect to coincide again as partners and work together again in future projects.
